	Primary Examiner, Art U 2/26/10	nit 2618	

The applicant argues that the Kushita reference does not teach a method where the second terminal detects the presence of the first terminal in the holder and receiving a signal that a first terminal is connected to the holder and thus establishing an automatic Bluetooth connection between the second terminal and the first terminal when the signal is received by the second terminal.

The examiner respectfully disagrees. Kushita reference discloses

- a first terminal with a short range communication module is connected to the holder. See col. 9, lines 18,19.
- said first terminal having a detector for detecting whether or not said first terminal is set to said holder, and for outputing a set signal when detecting that said first terminal is set to said holder, see col. 4, lines 18-37 where the holder or cradle 205 of the automobile system 200 holds the portable telephone and has a detection method to detect the presence of the portable phone in the holder or cradle and a control signal is set between the portable phone and the automobile system thus setting an automatic connection between the first terminal and the second terminal.

-said second control unit of said second terminal starts said second wireless connection interface in response to the set signal sent thereto from said detector, and establishes a wireless connection between said first terminal and said second terminal; see co.1.8, lines 32- co.1.9, line 27. Here the when the portable phone is in the cradle, a control signal is set and is indicated to the automobile system and a automatic connection is then established between the automobile system and the phone to the drive mode i.e. to disable the phone for speech communication. See also co.1.1, lines 5-45.

The secondary reference Numata teaches the use of Bluetooth module for short range communication.

The reference Lilja teaches a method wherein when the phone is placed in the holder or cradle the phone interface detects the presence of the phone in the holder and then the charging circuitry regulates and charges the mobile phone placed in the holder and thus powers the mobile unit to allow for the communication with the master electronic system of the automobile.

Therefore Kushita in combination with Numata and Lilia meets all the claimed limitation of independent claims 1 and 6.
